TITLE: Measuring the dynamic characteristics of pulse-frequency and pulse-duration modulators

SOURCE: Izmeritel'naya tekhnika, no. 11, 1964, 45-49 16

TOPIC TAGS: PFM, PDM, pulse frequency modulation, pulse duration modulation qm

ABSTRACT: A method for measuring the dynamic characteristics of PFM and PDM converters (having linear modulation characteristics) is described with a view toward determining the dynamic errors involved. Known methods from various published sources are held to be not reliable or accurate enough. New methods of determining PD deviation are based on comparing the specially shaped pulses from a PD modulator with pulses from a delay unit by means of an electron

Card 1/2

L 19822-65

ACCESSION NR: AP5001033

oscilloscope; or by comparing the PDM pulses with sawtooth-generator pulses on an oscilloscope screen when both apparatus are excited by clock pulses from a stable-frequency generator. Amplitude-frequency and phase-frequency characteristics can be measured by these methods. Modifications are mentioned. Orig. art. has: 6 figures and 17 formulas.

FIGURE: Deployment of assembly points for damaged armored vehicles /

SOURCE: Tekhnika i vkorushcheniye, no. 5, 1966, 32-35

**ARMED GUARDS:** armed force installation, motor vehicle, armored vehicle

**ABSTRACT:** The organization and deployment of assembly points in or near battle areas for repairing damaged tanks and various combat vehicles is discussed. In general, the field repair shops are to be located in well protected places with easy approaches, access roads and not far from water sources. It is not advisable to locate them in large populated places or close to road intersections. The probability of enemy actions including nuclear attacks must also be evaluated in selection of repair areas. The size of the area needed for the organization of assembly points depends upon the number of vehicles, repair shop equipment and facilities. It is estimated that an area of about 1 sq km would be needed for a well equipped and developed assembly point. In this connection, a table is presented where various recommended distances (between tanks, shops, etc.) and needed service areas (vehicle reception, parking, repair places, special shops, etc.) are indicated. Various security measures against surprise attacks and the organization of a

Card 2/2

L 09340-67

ACC NR: RP6027520

guard service and security patrols are reviewed including antiaircraft defense and anti-nuclear protection. An example of deployment of a protected assembly point for repairing military vehicles is presented on a drawing. The drawing shows the distribution of various repair services beginning from the decontamination of vehicles and ending with the parking area for repaired vehicles. The delivery of repaired vehicles to military units in escorted assembled groups is recommended. Orig. art. has: 1 figure, 1 table.

TITLE: Methods of measuring magnetic-recorder flutter

SOURCE: Priborostroyeniye, no. 12, 1964, 11-15

TOPIC TAGS: magnetic recorder, wow, flutter

ABSTRACT: The theory of wow and flutter is set forth, and known methods of flutter measurement are reviewed. These shortcomings of the methods are noted: they are either too complicated in practice or do not yield an output electrical signal usable for recording, analysis, or correction. A new method of flutter measurement is offered in which the effect of time modulation of the recorded signal is utilized. A pulse generator PG (see Enclosure 1) and a pulse-duration demodulator PDD are employed for obtaining a signal proportional to the flutter function. Pulses having a constant repetition frequency  $f_r$  are recorded on

Card 1/3

L 24854-65

ACCESSION NR: AP5001968

tape and simultaneously reproduced. PDD receives pulses from PG with a frequency  $f_o$  and the reproduction pulses with a frequency  $f_r = f_o [1 + d_4(t)]$  and forms new pulses whose one edge is determined by PG pulses and the other edge, by reproduction pulses. After a low-pass filter and a C-R differentiator, the signal voltage will be  $U_{out}^t = KSd_4(t)$ , where S is the slope of the PDD characteristic, and  $d_4(t)$  is the flutter. The latter can be easily examined in the course of investigating a tape-transport mechanism. Orig. art. has: 3 figures and 25 formulas.

TITLE: Signal spectra in a magnetic recording system for test information

SOURCE: IVUZ. Priborostroyeniye, v. 8, no. 2, 1965, 14-19

TOPIC TAGS: magnetic recording system, magnetic converter, pulse width modulation,  
pulse frequency modulation, signal spectrum

8

ABSTRACT: Test and measurement data are generally recorded magnetically by means of various forms of pulse modulation. On the one hand, this type of recording reduces the frequency range of the processes recorded by several times and, on the other, makes possible a sharp increase in the accuracy with which the test signals are transmitted. In the present article, the author considers the conversions of the input signal in a magnetic recording system with pulse-frequency and pulse-width modulation, as well as the distortions associated with these transformations. Some recommendations are given regarding the selection of the type and parameters of the modulation for a given magnitude of nonlinear distortions. Unilateral pulse-width modulation is considered, when the position of one pulse edge is determined by a clock pulse, with the position of the other

Card 1/3

L 44782-65

ACCESSION NR: AP5011729

edge changing as a function of the amplitude of the input signal. Attention is called to the existence of unilateral pulse-width modulation (UPWM) of the first and second order. In the case of first-order UPWM, pulse duration is determined by the value of the input signal at the moment of the appearance of the modulated edge of the pulse. With second-order UPWM, pulse duration is proportional to the value of the input signal at the moment corresponding to the transmission of the clock pulse. Modulators for both types of modulation are considered, and the structure of the frequency spectra of a pulse train with UPWM is analyzed. Also discussed is the signal spectrum in the case of pulse-frequency modulation, postulating, as before, ideal recording and reproduction systems. Here too, the author makes a distinction between pulse-frequency modulation of the first and second order: PFM-1 and PFM-2. In the first case, the position of the modulated pulse on the time axis corresponds to the magnitude of the input signal at the moment of the occurrence of this pulse; in the second case, the position of the pulse on the time axis is determined by the value of the signal at the moment corresponding to the position of the same pulse when modulation is absent. The frequency spectrum structure in PFM systems is analyzed with the same suppositions as were made in the case of UPWM; namely: 1. the input pulse is sinusoidal  $u = U \sin \omega t$ ; 2. the unmodulated pulse train consists of square-wave pulses of amplitude A and duration  $T$ . On the basis

Card 2/3

L 44782-65

ACCESSION NR: AP5011729

of her analysis of spectral structure with pulse-width (PWM) and pulse-frequency modulation (PFM) of the first and second order, the author draws the following conclusions: 1. In a magnetic system for recording test information with PWM and PFM, converters which bring about a modulation only of the first order can be used. 2. The amplitude of the signal component in the PWM-1 spectrum is determined only by the depth (percentage) of modulation, that is, by the magnitude of the signal, and does not depend on the ratio of frequencies  $\omega_0, \Omega$ . The amplitude of the signal component in the PFM-1 spectrum depends, in addition, on the ratio of the frequencies  $\omega_0, \Omega$ , and its variation under working conditions can be estimated as a quantity on the order of 1-2%. From this point of view, a PWM system is more accurate than a PFM system. 3. The use of PWM-1 and PFM-1 converters makes it possible to employ low-pass filters in demodulation. Orig. art. has: 3 figures and 4 formulas.

SOURCE: Fiziologichnyy zhurnal, v. 11, no. 3, 1965, 283-288

TOPIC TAGS: hypoxia, hemoglobin, 84000

ABSTRACT: The literature on human adaptation to high altitudes is surveyed. The author presents his findings on high altitude sickness, based on investigations conducted in the Pamirs, the Tien Shan, and the Caucasus. Preconditioning of mountain climbers in pressure chambers generally does little to prevent hypoxia. Swift ascent produces a rapid rise in erythrocytes and hemoglobin content. While gradual ascent (with 5-7 day stops at altitudes of 2000, 3000, 3400, 4700, and 4200 meters) results in a less pronounced rise in erythrocytes and hemoglobin content, the increase persists longer after the descent.

Stalin Prize, Kand. Tech. Sci., and to Morozov, S. A. for  
their valuable comments and assistance.

PURPOSE AND EVALUATION: The purpose of this book is to show the  
achievements of Russian invention in the field of photography  
and photographic cameras. This popular presentation reviews the  
development of photographic technology in Russia starting with  
the pre-Revolutionary period and going through the Soviet regime.  
Many cameras and lenses of Soviet make (up to 1940) are briefly  
described, and sketchy diagrams and some data given. The basic

conceptions of those cameras, judging from the diagrams, do not seem to present original ideas.

TEXT DATA

Coverage: This book outlines the history of Russian inventions in the field of photography and photo-camera production based on various sources found in the Russian State Archives and in various libraries. This survey is limited to the Russian contribution in the field of the theory, design and production of photographic apparatus and does not include the history of non-Russian contributions. The present book is a continuation of the work of the same author entitled: First Russian Photo-Cameras (Pervyye rasskiye fotoapparaty) Goskinizdat. 1951.

TITLE: The Work of Permanently Active Conferences on Production (O rabote postoyanno deystvuyushchikh proizvodstvennykh soveshchaniy)

PERIODICAL: Energetik, 1958, Nr 11, pp 35 - 36 (USSR)

ABSTRACT: The December Plenum of the Central Committee of the Communist Party of the Soviet Union indicated that it was necessary to make the production conferences at industrial concerns permanently active. A description of how this system has worked out in practice, and examples of helpful suggestions which have been made at the conferences are given.

TITLE: Graphic and analytical method of determining energy losses at hydroelectric power stations with a daily regulation system (Grafoanaliticheskiy metod opredeleniya poter' energii pri sutochnom regulirovani na hidroelektrostantsiakh)

PERIODICAL: Tr. in-ta energetiki AN BSSR, 1955, issue 2, pp 87-95  
(BSSR)

ABSTRACT: According to the proposed method, energy losses are determined separately in the head race and in the tail race. A.M. Morozov's method is used for the approximate calculation of the unsteady flow in the tail race. A graphic method for the determination of losses in the tail race is presented (it includes the use of the tailrace discharge chart and mass-flow curve of the hydroelectric power station), and also a method for determining losses in the head race (with the use of discharge chart, reservoir elevation capacity curve and of the radial reservoir yield gage). The total energy losses of a hydroelectric power

TITLE: Transients in the Pools of Small Hydroelectric Generating Stations  
(Neustanovivshiyesya rezhimy v b'yefakh malykh gidroelektrostantsiy)

PERIODICAL: Tr. In-ta energ. AN BSSR, 1957, Nr 3, pp 148-164

ABSTRACT: Actual observation records of daily water conditions at two small hydroelectric stations are reported: a 240-kw Novoselki station on the Molchad' River and a 2,250-kw Osipovichi station on the Svisloch' River. The observations have been made with these objectives in view: (1) nature of upstream and downstream transients; (2) nature of release-wave propagation in the rivers. It is noted that the velocity of propagation of a disturbance in the lower stream depends on the stream depth, this dependence being different for positive and negative waves. A vast amount of graphic and tabulated observation material is supplied. Bibliography: 2 items.

TITLE: On Plotting the Characteristics of Relative Gains of Water Power Stations (K postroyeniyu kharakteristik ot-nositel'nykh priostov gidroelektrostantsiy)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy - Energetika, 1959, Nr 1, pp 123-128 (USSR)

ABSTRACT: At present, the following relative gain characteristics of power stations are used to ensure the best possible distribution of load in power systems:

$$b = f(N \text{ tps}), \quad q = f(N \text{ wps}),$$

where  $b = \frac{dB}{dN}$  (for thermal power stations)

$$q = \frac{dQ}{dN} \quad (\text{for water power stations})$$

B = fuel consumption, Q = water consumption, N = power.  
The characteristics of relative gains for water power stations can be plotted (1) for constant marks of the

Card 1/3

SOV/143-59-1-16/17

On Plotting the Characteristics of Relative Gains of Water Power  
Stations

upper water level ( $Z_{ul} = \text{const}$ ) and (2) for constant heads ( $H_{agr} = \text{const}$ ). However, the results obtained by these two method are different, and the author shows that the second method for the determination of relative gains is inaccurate. Investigating the relations between the values  $Q$ ,  $N$ ,  $H$  and  $\eta$  ( $\eta$  stands for efficiency), he arrives at the formula

$$q - \frac{dQ}{dN} = \frac{1}{9.81 \cdot H\eta} - \frac{N}{9.81 \cdot H^2 \eta} \frac{dH}{dN} - \frac{N}{9.81 \cdot H\eta^2} \frac{d\eta}{dN}$$

and finds that the method in question neglects the derivative  $\frac{dH}{dN}$ . Then he goes on to propose a plotting method taking into consideration all terms of the formula. There are 6 diagrams and 1 Soviet reference.

TITLE: Methods of complex optimization of daily and long term operation conditions  
of combined power systems including hydroelectric stations

SOURCE: AN SSSR. Izvestiya. Energetika i transport, no. 1, 1965, 3-17

TOPIC TAGS: hydroelectric power plant, dynamic programming

ABSTRACT: The article includes a brief survey of literature on methods of optimization of operating conditions for combined power systems containing hydroelectric stations. The necessity of further study in the area of complex optimization of the daily and long-term operating conditions of such systems is shown. The gradient method and the gradient method combined with the group relaxation method and the principle of dynamic programming are used as a basis in the analysis of methods of optimization of the daily operating regimes of such systems and their sections. ABSTRACT: This Author's Certificate introduces: 1. A method for producing normal  
butanol by synthesis from ethyl alcohol on a catalyst. The process is done in a  
single stage by using a catalyst consisting of aluminum oxide, magnesium oxide,  
silicon oxide and a salt or oxide of an alkali metal. 2. A modification of this

SOURCE: Fizika metallov i metallovedeniye, v. 22, no. 3, 1966, 380-391  
TOPIC TAGS: magnetic anisotropy, epitaxial growing, hysteresis loop, metal film  
ABSTRACT: The authors study the epitaxial growth of iron, nickel and cobalt films  
thermally vaporized onto ionic crystals split in air and in a vacuum. It is shown that  
when the substrates are heated in a vacuum of  $10^{-4}$  mm Hg, the surface state is changed  
with a favorable effect on epitaxy. The phase composition of the film may be controlled  
by proper selection of the substrate. The fields of anisotropy of the films are  
measured and the effect which application of a magnetic field during vaporization has  
on the magnetic anisotropy of the films is studied. The domain structure of the films  
and its dynamics are analyzed and the results are used as a basis for explaining the  
shape of hysteresis loops. The coercive force is measured in films of various thickness.  
It is shown that the coercive force of the films is always much less than the  
field of anisotropy and is approximately inversely proportional to the saturation magnetization.
